1. INTRODUCTION

This manual describes the use and maintenance instructions of the MK pump, and should be carefully read and understood before using the pump.

Correct use and adequate maintenance will guarantee the pump's trouble-free operation for a long time.

The Interpump Group declines any responsibility for damage caused by misuse or the non-observance of the instructions indicated in this manual.

Upon receiving the pump, check that it is complete and in perfect conditions.

Should anything be found out of order, please contact us before installing and starting the pump.

2. SYMBOL DESCRIPTION

Warning Signal

Carefully read the indications in this manual before operating the pump.

Danger Signal Electrocution danger

Danger Signal Use face guard

Danger Signal Use protective glasses

Danger Signal Use adequate hand protection before operating the pump

Danger Signal Use appropriate boots

3. SAFETY

3.1 General safety indications

The misuse of pumps and high pressure units, and the non-observance of installation and maintenance instructions may cause severe injury to people and/or damage to property. Anyone requested to assemble or use high pressure units must possess the necessary competence to do so, should be aware of the characteristics of the components assembled/used, and must adopt all the necessary precautions in order to guarantee maximum safety in any operating condition. In the interest of safety, no precaution that is reasonably feasible must be neglected, both by the Manufacturer and the Operator.

3.2 High pressure unit safety requirements

1. The pressure line must always be equipped with a safety valve.

2. High pressure unit components, in particular for those units working outside, must be adequately protected against rain, frost and heat.

3. The unit's electrical parts must be adequately protected from water spray, and must comply with the specific norms in force.

- 4. High pressure pipes must be correctly sized for the unit's maximum operating pressure, and must only be used within the pressure range indicated by the pipe Manufacturer. The same conditions apply to all other unit accessories where high pressure is involved.
- 5. The extremities of high pressure pipes must be sheathed and fastened to a steady structure in order to avoid dangerous whiplashes should they burst or should their connections break.
- 6. Appropriate safety guards must be provided for the pump transmission systems (joints, pulleys and belts, auxiliary drives).

3.3 Safety during operation

The working area of a high pressure system must be clearly signalled. Access must be prohibited to non-authorised personnel and, if possible, the area must be fenced in. The personnel authorised to access this area must be previously trained and informed about the risks that may arise from failures or malfunctions of the high pressure unit.

Before starting the unit, the Operator must check:

- 1. That the high pressure unit is correctly fed (see paragraph 9.5).
- 2. That Pump intake filters are perfectly clean; we advise to use a device that indicates the filter's clogging level.
- 3. That electrical parts are adequately protected and in perfect conditions.
- 4. That high pressure pipes do not show apparent signs of abrasion, and that fittings are in perfect shape.
- Any anomaly or reasonable doubt that may arise before or during operation must be promptly reported, and verified by competent personnel. In these cases, pressure must be immediately released and the high pressure unit stopped.

3.4 General procedures for using nozzles

- 1. The Operator must always place his own and other worker's safety before any other interest; his actions should always be governed by good sense and responsibility.
- 2. The Operator must always wear a helmet with a protective visor, waterproof clothing, and appropriate boots capable of guaranteeing grip on wet pavements.

Note: appropriate clothing will effectively protect against water spray, but it may not offer adequate protection against the direct impact of water jets or sprays from a close distance. Some circumstances may require further protection.

- 3. We advise to employ a team of at least two Operators, able to provide mutual and immediate assistance if needed, and rotate their duties in case of long and heavy work.
- 4. Access to the work area that is within the water jet's range must be absolutely forbidden; the area must be free of objects that may be unintentionally hit by the pressurised jet, causing damage or dangerous situations.
- 5. The water jet must only and always be directed towards the work area, even during testing or preliminary inspections.
- 6. The Operator must always pay attention to the trajectory of the debris removed by the water jet. If necessary, adequate side guards must be provided by the Operator in order to protect anything that may be accidentally exposed.
- 7. For no reason must the Operator be distracted during operation. The personnel that needs to access the working area must wait for the Operator to suspend his work, and then immediately make his presence known.
- 8. For safety reasons, it is important that each member of the team is perfectly aware of the intentions and actions of other team members in order to avoid dangerous misunderstandings.
- 9. The high pressure unit must not be started and brought up to pressure unless each member of the team is in his designated position, and the Operator has already directed the nozzle towards the work area.

3.5 Safety during unit maintenance

- 1. The maintenance of the high pressure unit must be done within the time intervals indicated by the Manufacturer, who is responsible for the entire unit's compliance with the norms in force.
- 2. Maintenance must always be carried out by specialised and authorised personnel.
- 3. Assembly and disassembly of the pump and its various components must be performed exclusively by authorised personnel, using appropriate tools in order to avoid damage to components and connections.
- 4. To guarantee total reliability and safety, always use original spare parts.

4. PUMP IDENTIFICATION

Each pump is equipped with a rating plate that indicates:

Pump model and version Serial number Maximum rpm Power absorbed Hp - kW Pressure bar - P.S.I. Flow rate I/min - G.P.M

Pump model, version and serial number must always be specified when ordering spare parts.

5. TECHNICAL CHARACTERISTICS

| Madal | DDM | Flow | rate | Pres | sure | Power | | | |
|---------|------|-------|-------|------|------|-------|-----|--|--|
| WOUEI | | l/min | Gpm | bar | psi | kW | Нр | | |

| MK 60 | 1500 | 346 | 91.4 | 170 | 2465 | 112.5 | 153 | | |
| WIN OU | 1800 | 334 | 88.2 | 170 | 2465 | 108 | 147 | | |
| MIX CE | 1500 | 406 | 107.3 | 150 | 2175 | 116 | 158 | | |
| IVIN 65 | 1800 | 392 | 103.6 | 150 | 2175 | 112.5 | 153 | | |

6. DIMENSIONS AND WEIGHT

For dimensions and weight of MK40, MK45 and MK50 pumps, please refer to fig. 2.

For dimensions and weight of MK55, MK60 and MK65 pumps, please refer to fig. 2/a.

MK

Per dimensioni delle pompe MK-H.P. versione Hydraulic Pack fare riferimento alla fig. 2/b.

Per dimensioni delle pompe MK-L.P. versione Hydraulic Pack fare riferimento alla fig. 2/c.

7. INFORMATION REGARDING PUMP USE

The MK pump has been designed to operate with filtered water (see paragraph 9.7) at a maximum temperature of 40°C.

Other fluids may be used only upon the approval of the *Technical Department or Customer* Assistance Service.

7.1 Water temperature

The maximum water temperature allowed is 40°C. Nonetheless, it is possible to use the pump at temperatures of up to 60° for short periods of time. In this case we advise to consult the **Technical Department or Customer Assistance Service.**

7.2 Maximum flow rate and pressure values

The performance values indicated in the catalogue refer to the maximum performance of the pump. **Regardless** of the power used, pressure and maximum rpm values indicated on the plate may not be exceeded unless expressly authorised by the **Technical Department or Customer Assistance Service.**

7.3 Lowest rpm

Any rpm value that differs from what indicated in the performance table (see chapter 5) must be expressly authorised by the *Technical Department or Customer Assistance Service*.

7.4 Recommended lubricant oil types and Manufactures

The pump is delivered with lubricant oil compliant with room temperatures ranging from 0°C to 30°C. Some recommended lubricant types are indicated in the table below. These lubricants are treated with additives in order to increase corrosion protection and resistance to fatigue (according to DIN 51517 part 2).

As an alternative, Automotive SAE 85W-90 gearing lubricants may also be used.

| Hersteller Manufacturer Producteur | Schmieräl Lubricant Lubrifiant | Hersteller Manufacturer Producteur | Schn fig. 3 Lubr.com Lubrifiant | Hersteller Manufacturer Producteur | Schmieröl Lubricant Lubrifiant |
|--|---|--|--|--|---|
| Agip | AGIP ACER 220 | elf 🖗 | ELF POLYTELIS 220, Reductelf SP 220 | Shell | Shell Tellus Öl C 220 |
| ARAL | Aral Degol BG 220 | Esso | NUTO 220, TERESSO 220 | 525 | Wintershall Ersolan 220, Wintershall Wiolan CN 220 |
| BP | BP Energol HLP 220 | FINA | FINA CIRKAN 220 | TEXAGO | RANDO HD 220 |
| (ETSUT) | CASTROL Hyspin Vg 220, Castrol Magna 220 | | RENOLIN 212, RENOLIN DTA 220 | TOTAL | TOTAL Cortis 220 |
| | Falcon CL 220 | Mobil | Mobil DTE Oil BB | | |

Check the oil level by using the apposite oil level dipstick with minimum and maximum value notches ①, fig.3.

If necessary, refill from the oil cap ③, fig.3. Correct oil level inspection is done with the pump at room temperature; oil changed with the pump at working temperature, by removing the rear plug ②, fig.3.

Checking and changing oil is carried out as indicated in chapter 11.

The amount required is ~13.5 litres.

In any case, oil must be changed at least once a year since it may deteriorate by oxidation.

For room temperatures not included in the 0°C to 30°C range, follow the indications contained in the diagram below, keeping in mind that the oil must have a minimum viscosity of 180 cSt.

Viscosity / Room Temperature Diagram

Exhausted oil must be collected in an appropriate recipient and disposed of in apposite locations. In absolutely no case may it be dispersed in the environment.

8. PORTS AND CONNECTIONS

MK series pumps are provided with (see fig.4 and fig.4/a):

N° 2 inlet ports "IN": G2" in the versions MK40, MK45, MK50 Ø80 mm in the versions MK55, MK60, MK65

The line can be connected to either of the two inlet ports; the ones not being used must be hermetically sealed.

N° 1 drain port "DRAIN ": with G1/2" hole in the lower cover to monitor any water leakage due to wear of the pressure packings. In case of leaks, please consult the repair manual. **This hole must always be kept open.**

9. PUMP INSTALLATION

9.1 Installation

The pump must be installed in a horizontal position using the apposite perforated feet Ø16.5. The base must be perfectly flat and sufficiently rigid in order to avoid bending and misalignments on the pump / transmission coupling axis due to the torque applied during operation.

The pump is equipped with two lifting eyebolts to facilitate installation, as shown in the following figure.

The lifting eyebolts must not be removed.

Several Eyebolts are designed and sized for the pump weight, additional loads other than the pump weight its self are not allowed.

The pump's shaft (PTO) must not be rigidly connected to the motor unit.

- The following transmission types are suggested:
 - Flexible joint
 - Cardan joint (please respect the maximum working angle indicated by the Manufacturers)

- Belts; for correct application, please contact the **Technical Department or the Customer** Assistance Service

9.2 Sense of rotation

An arrow situated on the crankcase near the shaft indicates the correct sense of rotation. Standing in front of the pump head, the sense of rotation must be as shown in fig.5.

| Lato Dx | Right Side |
|------------|-------------------|
| Lato Sx | Left Side |
| orario | clockwise |
| antiorario | counter-clockwise |

fig. 5

9.3 Version change and reducer positioning

A right version pump is defined when:

observing the pump from the head side, the PTO shank of the pump shaft is on the right side.

A left version pump is defined when:

observing the pump from the head side, the PTO shank of the pump shaft is on the left side. (see fig.5).

The version may be changed only by specialised and authorised personnel by carefully following the instructions in the repair manual.

Furthermore, it is possible to position the reducer in 5 different positions, both on the right and left sides, as shown in fig.6.

The reducer's position may be changed only by specialised and authorised personnel by carefully following the instructions in the repair manual.

9.4 Hydraulic Connections

In order to isolate the system from the vibrations produced by the pump, we advise to build the first section of the duct near the pump (both for intake and delivery) with flexible tubes. The consistency of the intake section must allow to avoid deformation caused by the depressurisation produced by the pump.

9.5 Pump feeding

MK pumps must always be installed under positive head, i.e.they must receive water by gravity or by forced feeding, and never suck from a lower level.

The pumps can tolerate minimum NPSH even as low as 1 m. (3.28 ft.), however, to obtain a better volumetric efficiency and above all to avoid cavitation, the minimum NPSH available, measured at the pump inlet flange, will have to be at least equal or higher than the values shown in the chart below.

| | MK 40 | MK 45 | MK 50 | MK 55 | MK 60 | MK 65 |
|------------------------|-------|-------|-------|-------|-------|-------|
| NPSH _r (ft) | 14.8 | 18 | 21.3 | 24.6 | 26.2 | 29.5 |

For the pumps with higher displacement, that is MK 55 - 60 - 65, it is strongly recommended to use a booster pump to avid cavitation , in view of the geometry of the hydraulic section and of the remarkably high flow rates.

The booster pump must have the following specifications : flow rate at least double than the rated flow rate of the pump, and pressure between 2 and 3 bar (30 to 45 p.s.i.).

These feeding conditions must be respected in all running conditions.

Booster start-up must always precede piston pump start-up.

In order to protect the pump, we advise to install a pressure switch on the feeding line after the filters.

9.6 Suction line

For the pump's correct operation, the suction line must have the following characteristics:

1. A minimum internal diameter as indicated in the diagram in paragraph 9.9, and in any case equal or greater than the pump head's value.

- Along the duct, avoid localised diameter reductions that may cause pressure drops with
- subsequent cavitation. Absolutely avoid 90° elbows, connections with other pipes, bottlenecks,
- counter-slopes, upside-down "U" shaped curves, "T" connections.
- 2. The selected lay-out must allow to avoid cavitation.
- 3. It should be perfectly airtight, and built in a way that guarantees perfect sealing over time.
- 4. Avoid pump emptying when stopping (even partial emptying).
- 5. Do not use hydraulic-type fittings, 3 or 4 way fittings, adaptors, etc... since they may hinder the pump's performance.
- 6. Do not install Venturi tubes or injectors for detergent intake.
- 7. Avoid the use of standing valves, check valves, or any other type of one-way valves.
- 8. Do not connect the by-pass line from the valve directly to the pump suction line.
- 9. Provide appropriate baffle plates inside the tank in order to avoid that water flows coming from both the by-pass and feeding lines may create turbulence near the tank's outlet port.
- 10. Make sure that the suction line is perfectly clean inside before connecting it to the pump
- 11. The pressure gauge for checking booster pressure must be installed near the piston pump's outlet port, and always after the filters.

fig. 7

9.7 Filtering

On the pump's suction line, install two filters as indicated in fig.7 and fig.7/a.

Bypass

With the pneumatic adjustment valve.

The filter must be installed as close as possible to the pump, should allow easy inspection and have the following characteristics:

- 1. Minimum capacity 3 times greater than the pump's rated flow value.
- 2. Filter port diameters must not be smaller than the pump inlet ports
- 3. Filtration degree ranging between 200 and 360 μ m.

In order to guarantee correct pump operation, it is important to plan periodical cleaning of the filter depending on actual pump usage, water quality and real clogging conditions.

9.8 Delivery line

To obtain a correct delivery line, please comply with the following installation instructions:

- 1. The internal diameter of the pump must allow to guarantee correct fluid speed; see diagram in paragraph 9.9.
- 2. The first section of the pipe connected to the pump must be flexible in order to isolate pump vibrations from the rest of the system.
- 3. Use high pressure pipes and fittings that guarantee wide safety margins in any working condition.
- 4. Install a safety valve on the delivery line
- 5. Use pressure switches suitable for the pulsating loads typical of piston pumps.
- 6. In the design phase, take into proper account the pressure drop along the line, since this causes a reduction in usage pressure with respect to the value measured at the pump
- 7. If the pump pulsations are harmful for particular applications, install an appropriately sized pulsation damper on the delivery line.

9.9 Internal diameter of the pipeline

To determine the internal diameter of the piping, please refer to the following diagram:

Suction pipe

With a flow rate of ~ 400 l/min and water speed of 1 m/sec. The diagram line that connects the two scales intersects the central scale, indicating the diameters, at a value of ~ 90 mm.

Delivery pipe

With a flow rate of ~ 400 l/min and water speed of 5.5 m/sec. The diagram line that connects the two scales intersects the central scale, indicating the diameters, at a value of ~ 40 mm.

Optimum speed values obtainable with the Booster pump:

- Suction: $\leq 1 \text{ m/sec.}$
- Delivery: ≤ 5.5 m/sec.

| Linea di aspirazione | Suction line |
|----------------------|---------------|
| Linea di mandata | Delivery line |

The diagram does not take into account the pipe and valve resistance, the pressure drop due to the pipe length, the viscosity and the temperature of the pumped fluid. If necessary, contact our Technical Department or Customer Assistance Service.

9.10 V-belt transmission

As indicated in paragraph 9.1, only in exceptional cases may the pump be driven by a v-belt system. For correct lay-out sizing, please contact our **Technical Department or Customer Assistance Service.**

10. START-UP AND OPERATION

10.1 Preliminary Inspections

Before start-up, be sure that:

The suction line is connected and up to pressure (see Chapter 9): the pump must never run dry.

- 1. The suction line must be perfectly airtight.
- 2. All the On-Off valves between the pump and the feeding source are completely open. The delivery line must discharge freely in order to allow the air in the pump to be expulsed easily thus facilitating pump priming.
- 3. All suction / delivery connections and fittings must be correctly tightened.
- 4. Coupling tolerances on the pump / transmission axis (half-joint misalignment, Cardan inclination, belt tightening, etc.) must remain within the limits indicated by the transmission Manufacturer
- 5. The pump's oil level must be verified using the apposite dipsticks (position 1 fig.8).

In case the pump has not run for a long period of time, recover the correct operation of the suction valves by opening the three valve-lifting devices (see position 2 fig.9). Be sure to reclose the valves before pump start-up. See fig. 10 for the valve positions.

fig. 9

fig. 10

10.2 Start-up

- 1. When starting the pump for the first time, check for the correct sense of rotation

- Verify the pump's correct feeding
 The pump must be started off-load
 During operation, check that the rotating speed does not exceed the rated value
- 5. Before putting the pump under pressure let it run for at least 3 minutes
- 6. Before stopping the pump, release the pressure by acting on the adjustment valve or on any discharging device

In case of priming problems caused by insufficient feeding, it's possible to intervene by removing the three front caps on the head (see position 3 fig.11), (MK40 excluded).

11. PREVENTIVE MAINTENANCE

To guarantee pump reliability and efficiency, respect the maintenance intervals as indicated in the table below.

| Every 500 hours | Every 1500 hours | | | | | | | | | | |
|-----------------|---|--|--|--|--|--|--|--|--|--|--|
| Check oil level | Change oil | | | | | | | | | | |
| | Check / Replace [*] : - Valves - Valves seats - Valve springs - Valve guides | | | | | | | | | | |
| | Check / Replace *: - H.P. packings - L.P. packings | | | | | | | | | | |

* See Repair manual

12. STOPPING THE PUMP FOR LONG PERIODS

12.1 Filling the pump with an anti-corrosion emulsion or anti-freeze solution by using an external diaphragm pump as in the layout shown in paragraph 9.7

- a) Close the filter draining, if open.
 - b) Be sure that the connecting pipe is clean, spread with grease and connect it to the high pressure outlet port.
 - c) Fit a suction hose to the membrane pump. Open the pump suction connection and fit hose between it and the membrane pump.
 - d) Fill the container with the solution / emulsion.
 - e) Put the free extremities of the suction pipe and the high pressure outlet pipe inside the container
 - f) Start up the diaphragm pump
 - g) Pump the emulsion until it comes out of the high pressure outlet pipe
- h) Continue pumping for at least another minute; if needed, the emulsion can be reenforced, by adding for example Shell Donax
- i) Stop the pump, remove the pipe from the suction connection and close it with a plug
- j) Remove the pipe from the high pressure outlet port. Clean, grease and plug both connections and the pipes.

12.2 Pipes

- a) Before greasing and protecting the pipes according the previously described procedure, dry the connections using compressed air
- b) Cover with polyethylene
- c) Do not wrap them too tightly; be sure there is no folding

13. PRECAUTIONS AGAINST FREEZING

In areas and periods of the year where there is risk of freezing, follow the instructions indicated in Chapter 12 (see paragraph 12.2).

In the presence of ice, in no case must the pump be started until the entire circuit has been perfectly thawed out; not complying with this indication may cause serious damage to the pump.

14. WARRANTY TERMS

The pumps are guaranteed for a period of time of 12 months from the delivery date or for 1000 hours of operation, with the exception of parts subject to wear.

In any case, please refer to the contract terms for other warranty conditions.

The warranty is void if:

- a) The pump has been used for purposes that differ from what agreed.
- b) The pump has been fit with an electric or diesel engine with performance greater than what indicated in the table.
- c) The required safety devices were un-adjusted or disconnected.
- d) The pump was used with accessories or spare parts not supplied by the Interpump Group.
- e) Damage was caused by:
 - 1) improper use
 - 2) the non-observance of maintenance instructions
 - 3) use not compliant with operating instructions
 - 4) insufficient flow rate
 - 5) faulty installation
 - 6) incorrect positioning or sizing of the pipes
 - 7) non authorised design changes
 - 8) cavitation

15. TROUBLESHOOTING

The pump does not produce any noise:

- The pump is not primed and is running dry
- There is no water in the inlet line
- The valves are blocked
- The delivery line is closed and does not allow the air in the pump to be discharged

The pump pulses irregularly (knocking):

- Air suction Insufficient feeding
- Bends, elbows, fittings along the suction line obstruct the fluid's passage _
- The inlet filter is dirty or too small _
- The booster pump, where provided, supplies insufficient pressure or flow rate _
- The pump is not primed due to insufficient head or the delivery line is closed during _ primina
- The pump is not primed due to valve seizing
- Worn valves
- Worn pressure packings
- Incorrect operation of the pressure adjustment valve _
- Transmission problems

- Insufficient feeding (see the causes listed above)
- RPM are less than the rated value
- -Excessive amount of water by-passed by the pressure adjustment valve
- Worn valves
- Leakage from the pressure packings
- Cavitation due to:
 - 1) Wrong sizing of the suction pipe / undersized diameters
 - 2) Insufficient flow rate
 - 3) High water temperature

Insufficient pump pressure:

- The nozzle is (or has become) too large
- Insufficient RPM
- Leakage from the pressure packings _
- Incorrect operation of the pressure adjustment valve
- Worn valves

Overheated pump:

- The pump is overloaded (pressure or rpm exceed the rated values)
- Oil level is too low, or the oil is not of a suitable type, indicated in Chapter 7 (see paragraph 7.4)
- Incorrect alignment of the joint or the pulleys
- Excessive inclination of the pump during operation

Pipe Vibrations or Knocking:

- Air suction
- Incorrect operation of the pressure adjustment valve
- Valve malfunction
- Irregular drive transmission motion
